Playlist
Clustering

Data and EDA

- Playlist Data - 1M Playlists from Kagge (.JSON)
- Spotify API request for song analysis
 - Danceability, loudness, mode, speechiness, acousticness, instrumentalness, liveness, valance, tempo
 - Goal - cluster playlists using only these features
 - [Learn more about song analysis](#)
- Feature Selection
 - Take mean, std of song features in each playlist
 - Initially used min,max values but removed later on due to non-normal distribution
 - Method I ultimately chose works well with normally distributed data
 - Compromise between describing playlists better, and improving cluster shapes
 - 18 total features

Selecting Best Methods

- MinMaxScaler vs StandardScaler
- PCA vs NMF
- Kmeans
- DBSCAN
- Gaussian Mixture
- Bayesian Gaussian Mixture

Finalization

- Gaussian Mixture Model
- Use full dataset: 70,000 playlist, 6.3M songs
 - More than 5 followers, more than 20 songs
- Run at many K values and choose best (AIC Score)
- Scalability concerns - $O(NKD^3)$
- Try reducing complexity in the future
 - Fast Incremental Gaussian

Evaluating Labels

- Train at K=30, append labels
- Heatmap to evaluate labels by their features (training on all 18 features)
- Fit KNN to identify nearest neighbors to cluster centers, grouped by artist count
